| • M.Tech in Biomedical Engineering from IIIT Allahabad | Status - Graduated 2020 |
| • B.Tech in Electronics & Comm. from IIIT Allahabad | Status - Graduated 2018 |
| • Class 12 from International Indian School Jeddah | Status - Graduated 2014 |

Work History

Software Engineer at Infor, Hyderabad, Telangana

August 2023 to Current

- Used Python, FastAPI, SQL and REST APIs to build the backend services behind the Infor data platform, which other teams use to move, combine and analyse company data, so every team makes decisions from the same, current numbers.
- Architected the ETL pipeline on AWS and Linux, with Spark and Kafka processing the data behind the scenes, enabling real-time content suggestions and notification feeds across the platform.
- Used Git, CI CD, Docker and Kubernetes to release services with fewer bugs.
- Led design feedback across the SDLC in daily Agile stand-ups, tracking work in JIRA and mentoring juniors, using Claude and Amazon Kiro to catch bugs early.
- Supported exercise sessions by explaining Python and object oriented programming concepts after lectures so students could apply the material to course exercises.

Software Engineer at SNE Realty, Chennai, Tamil Nadu

May 2020 to June 2023

- Used Python, Django and REST APIs to build the system behind the SNE Realty property listings, so the company could manage properties, agents and customers in one place.
- Used Kafka and Node.js to keep property listings in sync across all company systems in real time, so customers only saw properties that were still available.
- Built an agent management system with a SQL database for the sales team, automating commission calculations and performance reports, so agents were paid correctly and managers saw who was doing well.
- Used web scraping, data cleaning and AWS speech services to match misspelled owner names in scraped listings to the right properties, which brought in more sales leads.

Software Engineer Intern at Al Watad Medical, Jeddah

Sep 2019 to March 2020

- Used Python, SQL and an event-driven design to track stock for a medical company and move its old records into a modern system, so staff could find what they needed quickly.
- Used Flask to build a web app for company inventory, so staff spent less time counting stock.
- Migrated microservices to GitLab with CI CD pipelines, using Docker to test every change to the stock app and its Kafka data, so updates were checked before they reached staff.
